

To ensure your eAPU is working efficiently this summer, it is time to clean and service the system.

Condenser Coil

Dirty Condenser Coil

When coils become dirty, they become inefficient and fail to properly cool the sleeper. Remove the cover from the condenser and use low-pressure water to rinse debris from the coil. Finish by rinsing all surfaces to remove salt deposits.

Dirty Condenser Coil

Garden Hose

Evaporator Coil

Don't overlook the evaporator just because it's inside the truck. Pet hair and other debris will plug the coil and filter. Remove and clean the evaporator filter by running water over it. Use a vacuum to remove hair and debris from the evaporator coil.

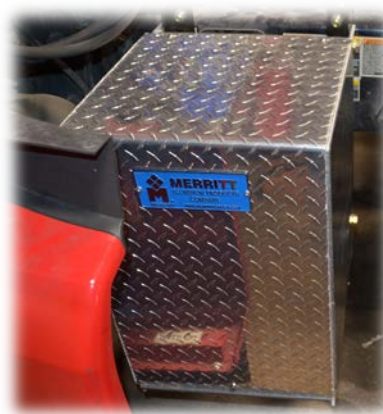

Evaporator plugged with hair

Clean evaporator filter

Battery Box and Batteries

Finally, remove the battery box cover from the battery box. Inspect and clean corrosion from all battery connections. Test batteries to ensure they are healthy and ready for the season. Batteries in poor shape will result in short run time.
