

It is time to clean equipment after a tough winter to ensure good system performance this summer.

Condenser Coil and Frame Rail Unit

Dirty Condenser Coil

When coils on air conditioning equipment get dirty, they become inefficient and fail to properly cool the sleeper. On the frame-rail unit, remove the cover and use a water hose with LOW PRESSURE output to rinse debris from the condenser coil. Finish by rinsing all surfaces to remove salt deposits.

Garden Hose

Evaporator Coil

Don't overlook the evaporator because it's inside the truck. Pet hair and other debris will plug the coil and filter. Remove and clean the evaporator filter by running water over it. Use a vacuum to remove hair and debris from the evaporator coil.

Evaporator plugged with hair
